

The BID sensor is designed to detect movement inside or outside the vehicle's protected range. The detection ranges can be adjusted from 1.6 ft to 32.8 ft. The ideal sensor offers 360 degrees of protection for many types of Motor Coach vehicles including campers, RV's, toy haulers and more. The sensor appears to be typical

light, but functions much differently. BID works with 12v power and requires 17 seconds power up time before it begins detecting the movements. During this period the red LED indicator will be constantly ON, and the sensor can not detect movements or output signal.

BID Motion Detection Features:

- Range of protection 1 foot to 20 feet
- Adjusts easily
- Looks like a light
- Communication with HDC controllers

Leave your compartments open and valuable goods visible in your vehicle while you are away worry free.
