

The BID sensor is designed to detect movement inside or outside the vessel's protected range. The detection ranges can be adjusted from 1.6 ft to 32.8 ft. Multiple BID sensors can be used at once. The ideal sensor offers 360 degrees of protection for many types of applications including vehicles, vessels and motor coaches.

The sensor works as an entry light with additional built in components. BID works with 12v power and requires 17 seconds power up time before it begins detecting the movements. During this period the red LED indicator will be constantly ON, and the sensor can not detect movements or output signal.

Pro Marine Keyless Entry

Pro Marine Keyless Entry interfaces with BID. It has many security features that can be easily programmed:

- Flex Switch Wireless Communication
- Programmable Logical Locking
 - Hatch or compartment power lock capable
- Engine Running Security
 - Tampered vessel automatically shuts down.
- Code Learning
 - All learned transmitters retained in memory
- Pre-Engine Start Warning
 - Door open warning at engine start or locking or apparatus out of position.
